1.1 What are Organizations

Organizations are social entity's, it consists of people and their relationships. Organizations are designed a structured/coordinated activity system which is goal directed and linked to the external environment thru partners, customers etc.

Not all organizations are the same, they can differ in Size, product, sector etc.

Organizations are systems. A system is a regularly interacting or interdependent group of items forming a unified whole whole surrounded and influenced by an environment.

There are two systems perspectives.

- (1) Closed systems perspective: Focus only on the inside of the organization. It is self-contained and sealed of to the outside. (Old fashioned view of organizations)
- (2) Open systems perspective: Organizations have inputs and outputs, which the organisational design shall manage.

A organization can have multiple business objectives:

- (1) Operational excellence
- (2) New products, services and business models
- (3) Customer and supplier intimacy
- (4) Improved decision making
- (5) Competitive advantage
- (6) Survival
- (7) Becoming more responsible

They also face some challenges:

- (1) Globalisation
- (2) Ethics and social responsibility
- (3) Responsiveness to changes
- (4) The digital workspace
- (5) Diversity

Organizations exist to bring resources together(Like building an aircraft carrier) or boosting innovation by delivering new goods & services.

Organizations have become so important because they make use of modern technologies and create value for owners, customers and employees.
